

BURST COMPUTE FOR KUBERNETES

Never run out of cluster.

Launch real CPU or GPU capacity into the Kubernetes cluster you already run—without moving the workload to a new platform.

01 / KEEP

Your cluster

No migration. Bursts appear as real Kubernetes Nodes and run real Pods.

02 / BOUND

Your budget

Attach a hard spend ceiling and deadline to every submitted workload.

03 / CHOOSE

Your operating mode

Submit a job in the web console or let an existing controller ask for nodes.

ONE INTERFACE · TWO JOBS

Simple for developers. Controlled by platform.

People who do not live in YAML can launch bounded work. Platform teams keep the identity, tenant, placement, and cost context around every run.

DEVELOPER LANE

From intent to workload.

The console turns the common path into a short, reviewable flow.

- ↳ Start with a container job, PyTorch training job, or node-only request.
- ↳ Set the image, command, CPU, memory, GPU, budget, and deadline.
- ↳ Review the exact workload YAML before launch.
- ↳ Follow status, inspect placement, and cancel from the same screen.

PLATFORM LANE

Guardrails stay visible.

Enterprise access and workload context are part of the product, not a side spreadsheet.

- ↳ Use Yscale ID with tenant membership and a clear active-tenant switcher.
- ↳ Assign owner, admin, member, and viewer roles.
- ↳ Carry provider, region, reliability, budget, and deadline inputs with the run.
- ↳ Keep human sessions separate from cluster connector credentials.

IDENTITY	One Yscale ID, tenant-scoped access, role-aware actions.
PLACEMENT	Automatic selection or explicit provider and region hints when the run needs them.
COST	Per-workload budget ceiling and deadline, recorded with the request.
DATA	Bucket credentials remain in a Kubernetes Secret inside the customer cluster.
AUDIT TRAIL	Template, inputs, lifecycle state, and placement remain attached to the workload record.

WORKLOAD RECEIPT		● RUNNING
template	PyTorch training	
shape	8 CPU · 32 GiB · 1 GPU	
placement	automatic	
deadline	45 minutes	
tenant role	member	
cluster	customer connector	
HARD CEILING		\$3.00

Keep your controllers.
Open the console.

KEDA, Argo, HPA, and Deployments can keep owning the Pods. Yscale supplies capacity underneath them; it does not replace them.
